

## MODELING OLD FAITHFUL'S ERUPTIONS

## Modeling Data

**H**ot springs that erupt intermittently in a column of steam and hot water are called geysers. Geysers may erupt in regular or irregular intervals and the intervals can last minutes, days, or even years.

For a geyser to exist, there needs to be a source of heat and water, a series of fissures and fractures called a plumbing system, and a formation of rocks that can withstand the pressure of steam explosions. Because of the different rates of heat and water flow and the differences in plumbing systems, the eruptions of some geysers are difficult to predict.

One geyser whose eruptions are predictable is the appropriately named Old Faithful. Located in Yellowstone National Park, Old Faithful is the world's most famous geyser.

### Observations

Some observations about Old Faithful's eruptions are listed below.

- On the average, eruptions reach heights of 106 to 184 feet and last 1.5 to 5.5 minutes.
- The interval between eruptions can be as short as 30 minutes or as long as 2 hours.
- The yearly average for the interval between eruptions has always been between 60 and 79 minutes.
- Each eruption ejects about 3700 to 8400 gallons of water.
- The temperature of water at Old Faithful's vent is about 204°F.

### Purpose

In this lab, you will model the data on Old Faithful's eruptions and the interval between the eruptions. You will compare your model with the model found using a graphing utility and the model Yellowstone Park uses to predict Old Faithful eruptions to see if you can describe what it means to have a "best-fitting" model.

# Data

The duration of Old Faithful's eruptions and the interval between the eruptions is given in the table below. Let  $x$  represent the duration of a geyser eruption in minutes. Let  $y$  represent the interval between geyser eruptions in minutes.

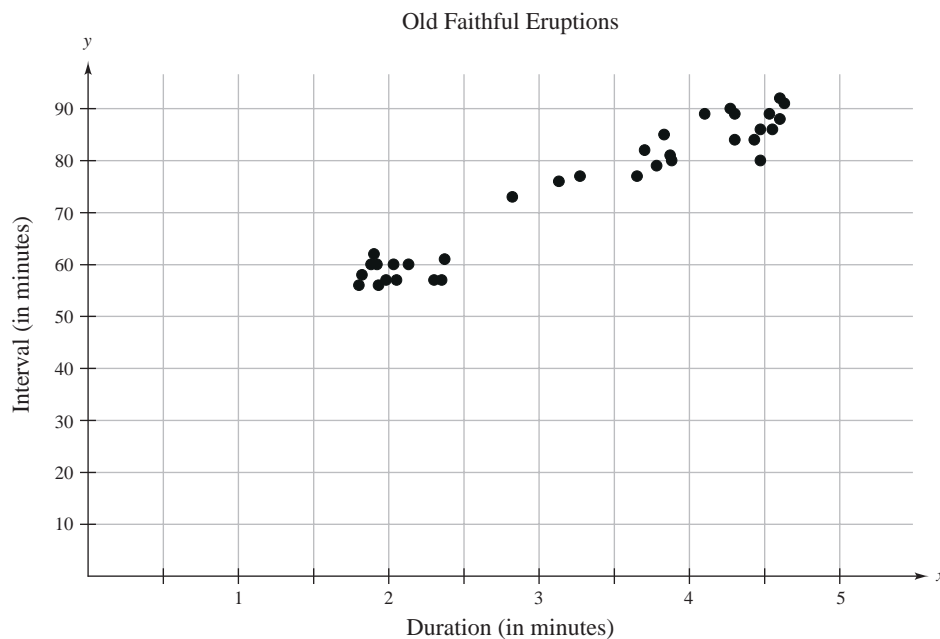

<b>Duration, <math>x</math></b>	1.80	1.82	1.88	1.90	1.92	1.93	1.98	2.03	2.05	2.13
<b>Interval, <math>y</math></b>	56	58	60	62	60	56	57	60	57	60

<b>Duration, <math>x</math></b>	2.30	2.35	2.37	2.82	3.13	3.27	3.65	3.70	3.78	3.83
<b>Interval, <math>y</math></b>	57	57	61	73	76	77	77	82	79	85

<b>Duration, <math>x</math></b>	3.87	3.88	4.10	4.27	4.30	4.30	4.43	4.43	4.47	4.47
<b>Interval, <math>y</math></b>	81	80	89	90	84	89	84	89	86	80

<b>Duration, <math>x</math></b>	4.53	4.55	4.60	4.60	4.63
<b>Interval, <math>y</math></b>	89	86	88	92	91

A scatter plot of the data is given below.

A graph of the parametric equations is stored in the graphing utility file called LAB01.

# Exercises

Name \_\_\_\_\_

Date \_\_\_\_\_ Class \_\_\_\_\_

Instructor \_\_\_\_\_

**1. Describe the Relationship.** Describe in words the numerical relationship between  $x$  and  $y$  as given in this lab's Data. Also suggest a possible explanation of why  $x$  and  $y$  are related in this manner.

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

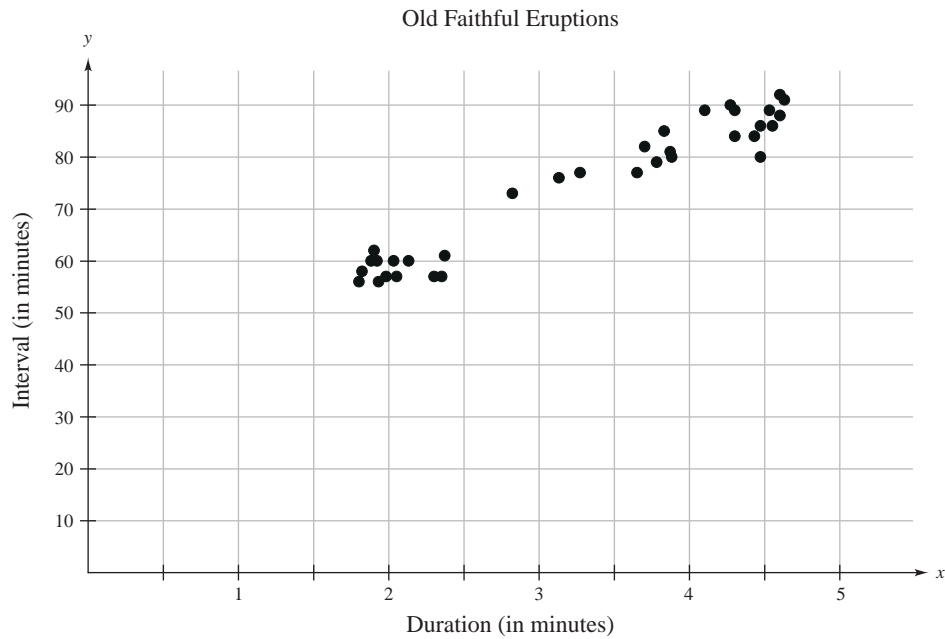

---

---

---

2. **Drawing a Best-Fitting Line.** Draw the line that seems to best fit the data points and find its equation (by hand).

3. **Is Your Model the Best?** Use the table given in this lab's Data and a graphing utility to compare the actual  $y$ -values and your equation's  $y$ -values. How good is your model? Do you think it is the best possible linear model? Explain your reasoning.

---

---

---

---

---

---

4. **Smaller or Larger Sum?** In this lab's graphing utility file the sum of the squares of the differences of the actual  $y$ -values and your equation's  $y$ -values is given. If you could find a better fitting linear model, would its sum be smaller or larger than the sum that is given? Explain your reasoning.

---

---

---

---

---

---

5. **“Least Squares” Method.** In statistics the linear model that best fits the data is found using what is called a “least squares” method. Based on your answer to Exercise 4, what do you think this means?

---

---

---

---

---

---

---

---

---

---

6. **Comparing Equations.** The equation used by Yellowstone Park to predict the intervals between Old Faithful’s eruptions is  $y = 14x + 30$ . Compare this equation with the one you found in Exercise 2. Which equation seems to be the “better” model? Explain your reasoning.

---

---

---

---

---

---

---

---

---

---

 7. **Choosing the Best Model.** In this lab’s graphing utility file, the least squares method is used to find the “best” linear model for the Old Faithful eruption data. Use the table to compare the actual  $y$ -values and the least squares model’s  $y$ -values. Of these two linear models and your own, which is the best one? Why?

---

---

---

---

---

---

---

---

---

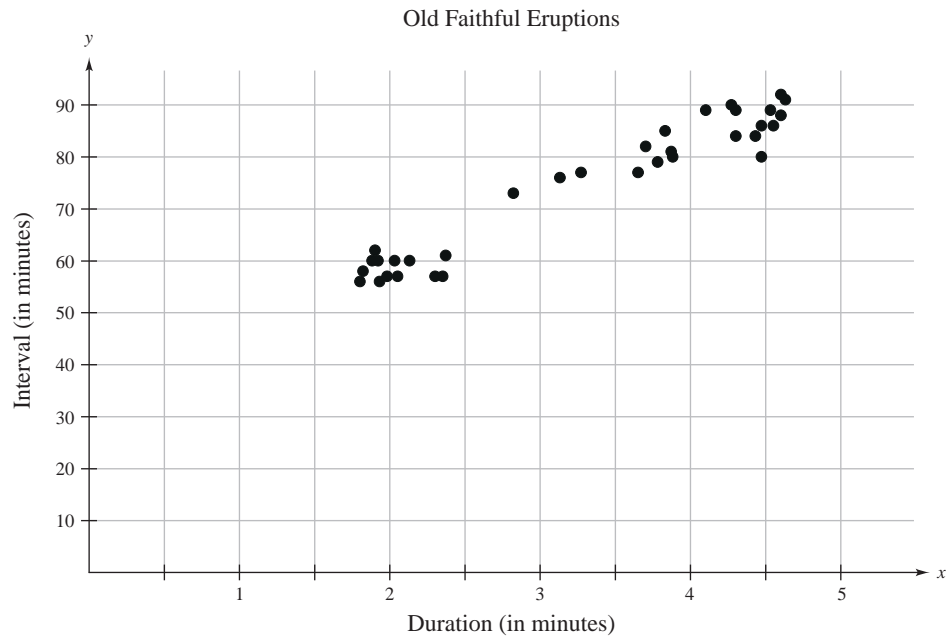

---

8. **Lab Summary.** Summarize your results and sketch the graph of each.

*Model from Exercise 2:* \_\_\_\_\_

*Yellowstone Park Model:* \_\_\_\_\_

*Least Squares Model:* \_\_\_\_\_

9. **A Better Type of Model?** Do you think a quadratic model would fit the data better than a linear model in this case? Why or why not?
